Lumineers

Lumineers are unique in that they are ultra-thin and highly translucent, allowing them to replicate the natural appearance of enamel. While traditional veneers are much thicker, requiring the grinding down of your original tooth structure, Lumineers are so thin that little to no tooth reduction is necessary. Additionally, the durability of Lumineers allows them to resist wear and remain resilient to last over 20 years.

Transforming Your Smile Couldn't Be Any Easier

It takes just a couple of visits to our office to bring out your beautiful smile with Lumineers. Getting started couldn't be easier. Here's how it works:

- After your initial consultation, we will take an impression of your upper and lower teeth, and send the mold to an authorized Lumineers laboratory along with photos and other records that ensure the very best case for you. Unlike traditional veneers, there is typically no need for extensive drilling, shots or unsightly acrylic temporaries.
- On your next visit, generally a couple weeks later, we will place your Lumineers. Before Lumineers are bonded in place, it is important to try them on to ensure a good fit. Teeth are then moderately etched to prepare for placement and then bonded one by one. Dr. Lanza will then check your bite to make sure your contacts are balanced to avoid chipping your Lumineers through the course of daily function.

It is that simple! Call our office today for a consultation.
